10 This application claims the benefit of priority from U.S. Provisional Patent Application Serial No. 60/264,275 filed January 26, 2001 and U.S. Provisional Patent Application Serial No. 60/323,842 filed September 21, 2001, each of which is incorporated herein by reference.

The present invention relates to compositions and therapeutic combinations comprising nicotinic acid or derivatives thereof and certain sterol absorption inhibitors for treating hyperlipidemic conditions such as are associated with atherosclerosis, hypercholesterolemia and other vascular conditions in mammals.

20 Atherosclerotic coronary heart disease (CHD) represents the major cause for death and vascular morbidity in the western world. Risk factors for atherosclerotic coronary heart disease include hypertension, diabetes mellitus, family history, male gender, cigarette smoke and serum cholesterol. A total cholesterol level in excess of 225-250 mg/dl is associated with significant elevation of risk of CHD.

25 Cholesteryl esters are a major component of atherosclerotic lesions and the
major storage form of cholesterol in arterial wall cells. Formation of cholesteryl esters
is also a key step in the intestinal absorption of dietary cholesterol. Thus, inhibition of
cholesteryl ester formation and reduction of serum cholesterol can inhibit the
progression of atherosclerotic lesion formation, decrease the accumulation of
30 cholesteryl esters in the arterial wall, and block the intestinal absorption of dietary
cholesterol].

The regulation of whole-body cholesterol homeostasis in mammals and animals involves the regulation of dietary cholesterol and modulation of cholesterol biosynthesis, bile acid biosynthesis and the catabolism of the cholesterol-containing plasma lipoproteins. The liver is the major organ responsible for cholesterol biosynthesis and catabolism and, for this reason, it is a prime determinant of plasma

cholesterol levels. The liver is the site of synthesis and secretion of very low density lipoproteins (VLDL) which are subsequently metabolized to low density lipoproteins (LDL) in the circulation. LDL are the predominant cholesterol-carrying lipoproteins in the plasma and an increase in their concentration is correlated with increased atherosclerosis. When intestinal cholesterol absorption is reduced, by whatever means, less cholesterol is delivered to the liver. The consequence of this action is decreased hepatic lipoprotein (VLDL) production and an increase in the hepatic clearance of plasma cholesterol, mostly as LDL. Thus, the net effect of inhibiting intestinal cholesterol absorption is a decrease in plasma cholesterol levels.

Nicotinic acid and its derivatives can inhibit hepatic production of VLDL and its metabolite LDL and increases HDL and apo A-1 levels.

U.S. Patents Nos. 5,767,115, 5,624,920, 5,668,990, 5,656,624 and 5,688,787, respectively, disclose hydroxy-substituted azetidinone compounds and substituted β -lactam compounds useful for lowering cholesterol and/or in inhibiting the formation of cholesterol-containing lesions in mammalian arterial walls. U.S. Patents Nos. 5,846,966 and 5,661,145, respectively, disclose hydroxy-substituted azetidinone compounds or substituted β -lactam compounds in combination with HMG CoA reductase inhibitors for preventing or treating atherosclerosis and reducing plasma cholesterol levels.

PCT Patent Application No. WO 00/38725 discloses cardiovascular therapeutic combinations including an ileal bile acid transport inhibitor or cholesteryl ester transport protein inhibitor in combination with a fibric acid derivative, nicotinic acid derivative, microsomal triglyceride transfer protein inhibitor, cholesterol absorption antagonist, phytosterol, stanol, antihypertensive agent or bile acid sequestrant.

U.S. Patent No. 5,698,527 discloses ergostanone derivatives substituted with disaccharides as cholesterol absorption inhibitors, employed alone or in combination with certain other cholesterol lowering agents, which are useful in the treatment of hypercholesterolemia and related disorders.

Despite recent improvements in the treatment of vascular disease, there remains a need in the art for improved compositions and treatments for hyperlipidaemia, atherosclerosis and other vascular conditions.

DETAILED DESCRIPTION

In one embodiment, the present invention is directed to compositions, pharmaceutical compositions, therapeutic combinations, kits and methods of treatment using the same comprising at least one (one or more) of nicotinic acid (niacin) or derivatives thereof(s) and at least one (one or more) of substituted azetidinone sterol absorption inhibitors or substituted β -lactam sterol absorption inhibitors such as are discussed in detail below.

As used herein, "nicotinic acid derivative" means a compound comprising a pyridine-3-carboxylate structure or a pyrazine-2-carboxylate structure, including acid forms, salts, esters, zwitterions and tautomers, where available. Examples of nicotinic acid derivatives include niceritrol, nicofuranose and acipimox (5-methyl pyrazine-2-carboxylic acid 4-oxide). Nicotinic acid and its derivatives inhibit hepatic production of VLDL and its metabolite LDL and increases HDL and apo A-1 levels. An example of a suitable nicotinic acid product is NIASPAN® (niacin extended-release tablets) which are available from Kos.

The nicotinic acid or derivatives thereof(s) are administered in a therapeutically effective amount to treat the specified condition, for example a total daily dosage of nicotinic acid or a derivative thereof can range from about 500 to about 10,000 mg/day, preferably about 1000 to about 8000 mg/day, and more preferably about 3000 to about 6000 mg/day, given in a single dose or 2-4 divided doses. The exact dose, however, is determined by the attending clinician and is dependent on such factors as the potency of the compound administered, the age, weight, condition and response of the patient.

The phrase "therapeutically effective amount" means that amount of a therapeutic agent of the composition, such as the nicotinic acid or derivatives thereof(s), sterol absorption inhibitor(s) and pharmacological or therapeutic agents described below, that will elicit a biological or medical response of a tissue, system, animal or mammal that is being sought by the administrator (such as a researcher, doctor or veterinarian) which includes alleviation of the symptoms of the condition or disease being treated and the prevention, slowing or halting of progression of one or more conditions, for example vascular conditions, such as hyperlipidemia (for example atherosclerosis, hypercholesterolemia or sitosterolemia), vascular inflammation, stroke, diabetes, obesity and/or to reduce the level of sterol(s) (such as cholesterol) in the plasma.

As used herein, "combination therapy" or "therapeutic combination" means the administration of two or more therapeutic agents, such as nicotinic acid or derivatives thereof(s) and sterol absorption inhibitor(s), to prevent or treat a condition, for example a vascular condition, such as hyperlipidaemia (for example atherosclerosis, hypercholesterolemia or sitosterolemia), stroke, diabetes, obesity and/or reduce the level of sterol(s) in the plasma. As used herein, "vascular" comprises cardiovascular, cerebrovascular and combinations thereof. Such administration includes coadministration of these therapeutic agents in a substantially simultaneous manner, such as in a single tablet or capsule having a fixed ratio of active ingredients or in multiple, separate capsules for each therapeutic agent. Also, such administration includes use of each type of therapeutic agent in a sequential manner. In either case, the treatment using the combination therapy will provide beneficial effects in treating the condition. A potential advantage of the combination therapy disclosed herein may be a reduction in the required amount of an individual therapeutic compound or the overall total amount of therapeutic compounds that are effective in treating the condition. By using a combination of therapeutic agents, the side effects of the individual compounds can be reduced as compared to a monotherapy, which can improve patient compliance. Also, therapeutic agents can be selected to provide a broader range of complementary effects or complimentary modes of action.

As discussed above, the compositions, pharmaceutical compositions and therapeutic combinations of the present invention comprise one or more substituted azetidinone or substituted β -lactam sterol absorption inhibitors discussed in detail below. As used herein, "sterol absorption inhibitor" means a compound capable of

inhibiting the absorption of one or more sterols, including but not limited to cholesterol, phytosterols (such as sitosterol, campesterol, stigmasterol and avenosterol), 5 α -stanols (such as cholestanol, 5 α -campestanol, 5 α -sitostanol), and mixtures thereof, when administered in a therapeutically effective (sterol absorption inhibiting) amount to a mammal.

In a preferred embodiment, sterol absorption inhibitors useful in the compositions, therapeutic combinations and methods of the present invention are represented by Formula (I) below:

(I)

20 alkyl chains having from 1 to 6 carbon atoms and "alkoxy" means alkoxy groups having 1 to 6 carbon atoms. Non-limiting examples of lower alkyl groups include, for example methyl, ethyl, propyl, and butyl groups.

"Alkenyl" means straight or branched carbon chains having one or more double bonds in the chain, conjugated or unconjugated. Similarly, "alkynyl" means straight or
25 branched carbon chains having one or more triple bonds in the chain. Where an alkyl, alkenyl or alkynyl chain joins two other variables and is therefore bivalent, the terms alkylene, alkenylene and alkynylene are used.

"Cycloalkyl" means a saturated carbon ring of 3 to 6 carbon atoms, while "cycloalkylene" refers to a corresponding bivalent ring, wherein the points of
30 attachment to other groups include all positional isomers.

"Halogeno" refers to fluorine, chlorine, bromine or iodine radicals.

"Aryl" means phenyl, naphthyl, indenyl, tetrahydronaphthyl or indanyl.

"Phenylene" means a bivalent phenyl group, including ortho, meta and para-substitution.

The statements wherein, for example, R, R¹, R² and R³, are said to be
5 independently selected from a group of substituents, mean that R, R¹, R² and R³ are
independently selected, but also that where an R, R¹, R² and R³ variable occurs more
than once in a molecule, each occurrence is independently selected (e.g., if R is -OR⁶,
wherein R⁶ is hydrogen, R² can be -OR⁶ wherein R⁶ is lower alkyl). Those skilled in
the art will recognize that the size and nature of the substituent(s) will affect the
10 number of substituents that can be present.

Compounds of the invention have at least one asymmetrical carbon atom and
therefore all isomers, including enantiomers, stereoisomers, rotamers, tautomers and
racemates of the compounds of Formulae (I-XI) (where they exist) are contemplated
as being part of this invention. The invention includes d and l isomers in both pure
15 form and in admixture, including racemic mixtures. Isomers can be prepared using
conventional techniques, either by reacting optically pure or optically enriched starting
materials or by separating isomers of a compound of the Formulae I-XI. Isomers may
also include geometric isomers, e.g., when a double bond is present..

Those skilled in the art will appreciate that for some of the compounds of the
20 Formulas I-XI, one isomer will show greater pharmacological activity than other
isomers.

Compounds of the invention with an amino group can form pharmaceutically
acceptable salts with organic and inorganic acids. Examples of suitable acids for salt
formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic,
25 malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and
carboxylic acids well known to those in the art. The salt is prepared by contacting the
free base form with a sufficient amount of the desired acid to produce a salt. The free
base form may be regenerated by treating the salt with a suitable dilute aqueous base
solution such as dilute aqueous sodium bicarbonate. The free base form differs from
30 its respective salt form somewhat in certain physical properties, such as solubility in
polar solvents, but the salt is otherwise equivalent to its respective free base forms for
purposes of the invention.

Certain compounds of the invention are acidic (e.g., those compounds which possess a carboxyl group). These compounds form pharmaceutically acceptable salts with inorganic and organic bases. Examples of such salts are the sodium, potassium, calcium, aluminum, gold and silver salts. Also included are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

As used herein, "solvate" means a molecular or ionic complex of molecules or ions of solvent with those of solute (for example, one or more compounds of Formulae I-XI, isomers of the compounds of Formulae I-XI, or prodrugs of the compounds of Formulae I-XI). Non-limiting examples of useful solvents include polar, protic solvents such as water and/or alcohols (for example methanol).

As used herein, "prodrug" means compounds that are drug precursors which, following administration to a patient, release the drug *in vivo* via some chemical or physiological process (e.g., a prodrug on being brought to the physiological pH or through enzyme action is converted to the desired drug form).

The compositions and therapeutic combinations of the present invention can be administered to a mammal in need of such treatment in a therapeutically effective amount to treat vascular conditions such as atherosclerosis, hyperlipidaemia (including but not limited to hypercholesterolaemia, hypertriglyceridaemia, sitosterolemia), stroke, diabetes, obesity, and/or reduce the level of sterol(s) in the plasma. The compositions and treatments can be administered by any suitable means which produce contact of these compounds with the site of action in the body, for example in the plasma, liver or ileum of a mammal or human.

The daily dosage for the various compositions and therapeutic combinations described above can be administered to a patient in a single dose or in multiple subdoses, as desired. Subdoses can be administered 2 to 6 times per day, for example. Sustained release dosages can be used. Where the nicotinic acid or derivatives thereof(s) and sterol absorption inhibitor(s) are administered in separate dosages, the number of doses of each component given per day may not necessarily be the same, e.g., one component may have a greater duration of activity and will therefore need to be administered less frequently.

Since the present invention relates to reducing the plasma sterol (especially cholesterol) concentrations or levels by treatment with a combination of active ingredients wherein the active ingredients may be administered separately, the invention also relates to combining separate pharmaceutical compositions in kit form. That is, a kit is contemplated wherein two separate units are combined: a pharmaceutical composition comprising at least one of nicotinic acid or a derivative

thereof and a separate pharmaceutical composition comprising at least one sterol absorption inhibitor as described above. The kit will preferably include directions for the administration of the separate components. The kit form is particularly advantageous when the separate components must be administered in different dosage forms (e.g., oral and parenteral) or are administered at different dosage intervals.

Non-limiting examples of pharmaceutically acceptable carriers include solids and/or liquids such as ethanol, glycerol, water and the like. The amount of carrier in the treatment composition can range from about 5 to about 99 weight percent of the total weight of the treatment composition or therapeutic combination. Non-limiting examples of suitable pharmaceutically acceptable excipients and additives include non-toxic compatible fillers, binders such as starch, disintegrants, buffers, preservatives, anti-oxidants, lubricants, flavorings, thickeners, coloring agents, emulsifiers and the like. The amount of excipient or additive can range from about 0.1 to about 90 weight percent of the total weight of the treatment composition or therapeutic combination. One skilled in the art would understand that the amount of carrier(s), excipients and additives (if present) can vary.

The treatment compositions of the present invention can be administered in any conventional dosage form, preferably an oral dosage form such as a capsule, tablet, powder, cachet, suspension or solution. The formulations and pharmaceutical compositions can be prepared using conventional pharmaceutically acceptable and conventional techniques. Several examples of preparation of dosage formulations are provided below.

The following formulations exemplify some of the dosage forms of this invention. In each formulation, the term "Active Compound I" designates a substituted azetidinone compound, β -lactam compound or any of the compounds of Formulas I-VIII described herein above and the term "Active Compound II" designates nicotinic acid or derivatives thereof described herein above.

The treatment compositions and therapeutic combinations of the present invention can inhibit the intestinal absorption of cholesterol in mammals, and can be useful in the treatment and/or prevention of vascular conditions, such as atherosclerosis, hypercholesterolemia and sitosterolemia, diabetes, obesity and lowering of plasma levels of cholesterol in mammals, in particular in mammals..

In another embodiment of the present invention, the compositions and therapeutic combinations of the present invention can inhibit sterol absorption or reduce plasma concentration of at least one sterol selected from the group consisting of phytosterols (such as sitosterol, campesterol, stigmasterol and avenosterol), 5 α -stanols (such as cholestanol, 5 α -campestanol, 5 α -sitostanol), cholesterol and mixtures thereof. in combination with niacin. Compound XII can be prepared as shown in Example 9 of U.S. Patent No. 5,688,787, which is incorporated by reference herein.

5 Hamsters were fed a cholesterol-containing diet for 7 days, which resulted in a 2-fold increase in plasma cholesterol and a 20-fold increase in hepatic cholesteryl esters. It was hypothesized that a compound which blocks dietary cholesterol absorption would reduce the accumulation of hepatic cholesteryl esters and inhibit the increase in plasma total cholesterol levels, while niacin should reduce plasma
10 triglyceride levels.

Male Golden Syrian hamsters (Charles River Labs, Wilmington, MA) weighing between 100 and 125g were fed Wayne rodent chow until study onset. At study onset (Day 1) animals were separated into groups (n=4-6/group) and fed chow supplemented with 0.5% by weight of cholesterol (Research Diets Inc., New
15 Brunswick, NJ). The Control and Test compounds were administered once daily for 7 days, starting on Day 1 via oral gavage in 0.2 ml corn oil. Corn oil was used as the Control. The Test compounds included the compound of Formula (XII) (3mg/kg of body weight/day), niacin (100mg/kg of body weight/day), or the compound of Formula (XII) combined with niacin as described in Table 1 below.

20 On Day 7, blood was collected into tubes containing ethylenediaminetetraacetic acid (EDTA), and plasma was prepared by low speed centrifugation at 4°C. Liver samples (0.5g) were taken for neutral lipid analyses.

Nonfasted plasma cholesterol levels were determined by a modification of the cholesterol oxidase method, in which the reagents were available in a kit form from
25 Wako Pure Chemicals Industries, Ltd. (Osaka, Japan). Ten µl of plasma was assayed for total cholesterol in 1 ml of 0.15 M tris buffer, pH 7.0 containing p-chlorophenol (0.1%), cholesterol oxidase (0.13 U/ml), cholesteryl ester hydrolase (0.13 U/ml), peroxidase (2.4 U/ml) and 4-aminoantipyrine (0.015%). Assays were carried out at 37°C for 10 min, along with cholesterol standards (Sigma Chemical Co., St. Louis,
30 MO) and the resultant red quinone pigment's absorbance was determined spectrophotometrically at 505 nm.

THIS PAGE BLANK (USPTO)

Plasma triglyceride levels were determined enzymatically by a modification of the lipase-glycerol phosphate oxidase method, obtained in a kit form from Sigma Chemical Co. Ten μ l of plasma and glycerol standards were added to 1 ml of buffer, pH 7.0 containing ATP (0.3 mmol/l), Mg (3.0 mmol), 4-aminoantipyrine (0.15 mmol/l),
 5 Na N-ethyl-N-(3-sulfopropyl) n-anisidine (1.69 mmol/l), lipase (50,000 U/l), glycerol kinase (1000 U/l), glycerol phosphate oxidase (2000 U/l), and peroxidase (2000U/l), incubated at 37°C for 5 min., and the absorbance of the quinonemine dye was evaluated spectrophotometrically at 540 nm.

Samples of liver (0.5g) were lipid extracted. Lipid extracts were dried under
 10 nitrogen into HPLC sample vials, resuspended in hexane and injected onto a Zorbax Sil (4.6 x 25 cm) silica column. Chromatography was performed using an isocratic mobile phase containing 98.8% hexane and 1.2% isopropanol at a flow rate of 2 ml/min. Lipids were detected by absorbance at 206 nm and quantitated by computer integration (System Gold, Beckman) of elution profiles. Elution time for cholesteryl
 15 ester was 1.45 min. Cholesteryl ester content of liver-derived samples was derived from a standard curve constructed using known amounts of cholesteryl oleate. Cholesteryl oleate was used as the standard since this is the major cholesteryl ester species present in the liver and this specific cholesteryl ester has an extinction coefficient that approximates that of a weighted average for all the cholesteryl esters
 20 present in the liver.

Table 1

Group	Plasma Cholesterol (mg/dl)	Plasma Triglyceride (mg/dl)	Hepatic Cholesteryl Ester (mg/g)
Control	283 \pm 17	224 \pm 21	24.94 \pm 1.39
Compound XII 3mg/kg/day	214 \pm 13	200 \pm 30	12.75 \pm 1.12
Niacin 100mg/kg/day	252 \pm 17	169 \pm 17	22.05 \pm 1.39
Compound XII (3mg/kg/day) + Niacin (100mg/kg/day)	238 \pm 6	164 \pm 28	14.93 \pm 2.04

25 As shown in Table 1, Compound XII reduced plasma cholesterol levels and the accumulation of hepatic cholesteryl esters in the cholesterol-fed hamsters. Niacin reduced plasma triglyceride levels, but did not significantly reduce the cholesterol levels. The combination of Compound XII and niacin resulted in reductions in plasma and hepatic cholesterol levels, as well as plasma triglycerides (Table 1). These
 30 results indicate that the combination of the cholesterol absorption inhibitor of

Compound XII and niacin can have additive effects on treating hyperlipidemia in male Golden Syrian hamsters, by reducing both cholesterol and triglyceride levels.

EXAMPLE 2

5 PREPARATION OF COMPOUND OF FORMULA (II)

Step 1): To a solution of (S)-4-phenyl-2-oxazolidinone (41 g, 0.25 mol) in CH₂Cl₂ (200 ml), was added 4-dimethylaminopyridine (2.5 g, 0.02 mol) and triethylamine (84.7 ml, 0.61 mol) and the reaction mixture was cooled to 0°C. Methyl-4-(chloroformyl)butyrate (50 g, 0.3 mol) was added as a solution in CH₂Cl₂ (375 ml) dropwise over 1 h, and the reaction was allowed to warm to 22°C. After 17 h, water and H₂SO₄ (2N, 100 ml), was added the layers were separated, and the organic layer was washed sequentially with NaOH (10%), NaCl (sat'd) and water.
